

UnderRoot · Soil Analysis Report

Test #3 · Field · 2026-09-29 09:45:17.827822

Overall soil health: **100.0/100** — **Excellent**

Measured Soil Parameters

Parameter	Value	Unit	Status
pH	6.8		Optimal
Nitrogen (N)	180.0	kg/ha	Optimal
Phosphorus (P)	45.0	kg/ha	Optimal
Potassium (K)	220.0	kg/ha	Optimal
Electrical Conductivity (EC)	0.65	dS/m	Optimal
Soil Moisture	24.0	%	Optimal
Soil Temperature	28.0	°C	Optimal
Organic Carbon	0.75	%	Optimal

Crop Recommendations

Crop	Suitability	Season	Notes
Maize	61.2%	Kharif (Jun–Jul sowing)	Makka (maize) is a good choice for your soil. Sow after first rain in June–July. Water regularly — do not let soil dry out.
Cotton	17.7%	Kharif (Apr–May sowing)	Kapas (cotton) can grow in your soil. Sow in April–May. Needs regular watering every 10–15 days. Pests may be a concern.
Pigeonpea	6.3%	Kharif (Jun–Jul sowing)	Arhar/Tur (pigeonpea) has deep roots and suits your soil well. Sow at start of monsoon. Drought-tolerant.
Wheat	5.8%	Rabi (Oct–Nov sowing)	Gehun (wheat) grows well in your soil. Sow in October–November. Water 5–6 times during the season.

Fertilizer Recommendations

Recommendation	Type	Dose	Notes
Balanced NPK	inorganic	See dose details in the description below.	For optimal growth, your soil needs all three nutrients — Nitrogen (N), Phosphorus (P), and Potassium (K). Buy NPK 10:10:10 or similar.

Decision-support notice: The analysis above is an indicative screening based on published range thresholds for Indian agricultural conditions. Values and recommendations should be confirmed with a certified soil testing laboratory or local agricultural officer before making input decisions.
